SPW3842D

High Performance Current Mode
Controlers

RoHS Compliant Product

Description

The SPW3842D is high performance fixed frequency current mode controllers. This is specifically designed for Off-Line and DC TO DC converter applications offering the designer a cost-effective solution with min. external components. These integrated circuits feature a trimmed oscillator for precise duty cycle control. A temperature compensated reference, high gain Error amplifier, current sensing comparator, and a high current totem pole output ideally suited for driving a power MOSFET. Also included are protective features consisting of input and reference undervoltages lockouts each with hysteresis, cycle-by-cycle current limiting, programmable output deadtime, and latch for single pulse metering.

Features

- * Low Startup And Operating Current
- * Automatic Feed Forward Compensation
- * High Current Totem Pole Output
- * Trimmed Oscillator For Precise Frequency Control
- * Oscillator Frequency Garanteed At 250kHz
- * Undervoltage Lockout With Hysteresis
- * Current Mode Operation To 500kHz
- * Internally Trimmed Reference With Undervoltage Lockout
- * latching PWM For Cycle-By-Cycle Current Limiting

DIP-8L	Function	Description
	Pin1: Compensation	This pin is the Error Amplifier output and is made available for loop compensation.
	Pin2: Voltage Feedback	This is the inverting input of the Error Amplifier. It's normally connected to the Switching power supply output through a resistor divider.
	Pin3: Current Sense	A voltage proportional to inductor current is connected to this input .The PWM uses this information to terminate the output switch conduction.
	Pin4: RT/CT	The oscillator frequency and maximum output duty cycle are programmed by connecting resistor RT to Vref and capacitor CT to ground. Operation 500kHz is possible.
	Pin5: Ground	This pin is the combined control circuitry and power ground.
	Pin6: Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1 A are sourced and sunk by this pin.
	Pin7: Vcc	This pin is the positive supply of the control IC.
	Pin8: Vref	This is the reference output. It provides charging current for capacitor CT through resistor RT.

Application Information

Open Loop Test Circuit

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin5 in a single point ground. The transistor and 5KΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin3.

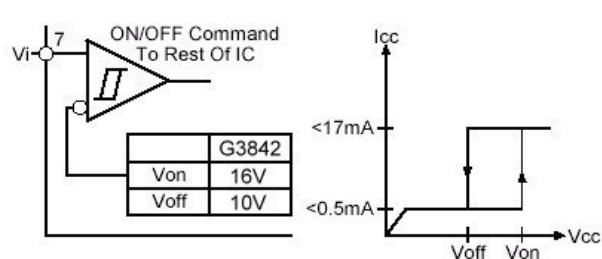

Oscillator and Output Waveforms

Error Amp Configuration

Under Voltage Lockout

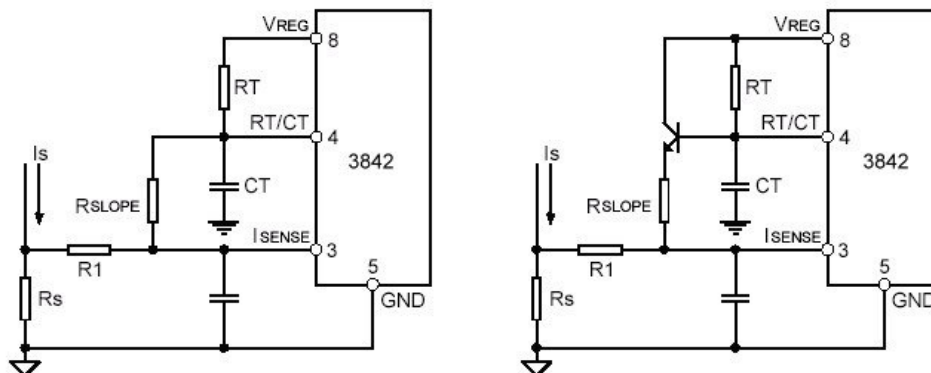

Current Sense Circuit

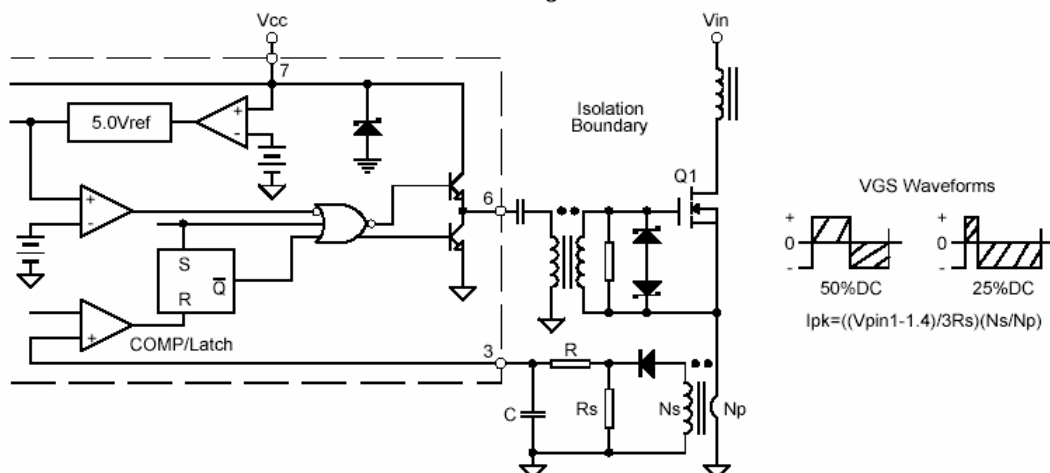

Peak current (I_s) is determined by the formula
 $I_{s(max)} \approx 1V/R_s$
 A small RC filter may be required to suppress switch transients.

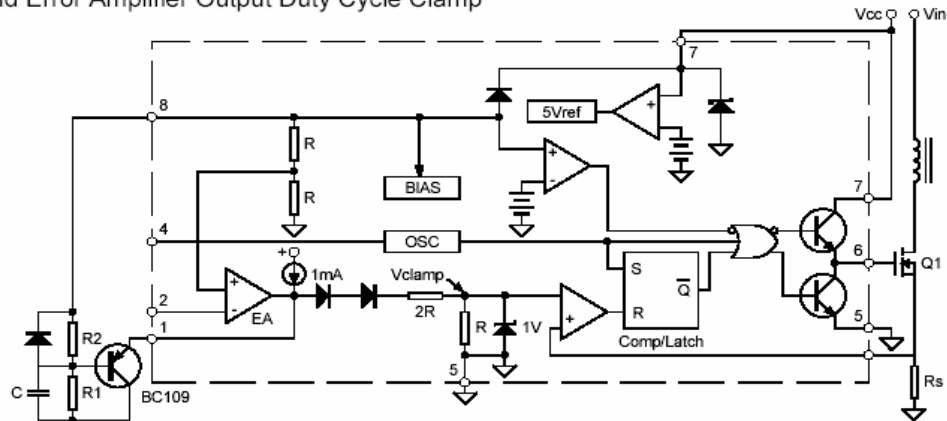

Slope Compensation Techniques

Isolated MOSFET Drive and Current Transformer Sensing

Soft-Start and Error Amplifier Output Duty Cycle Clamp

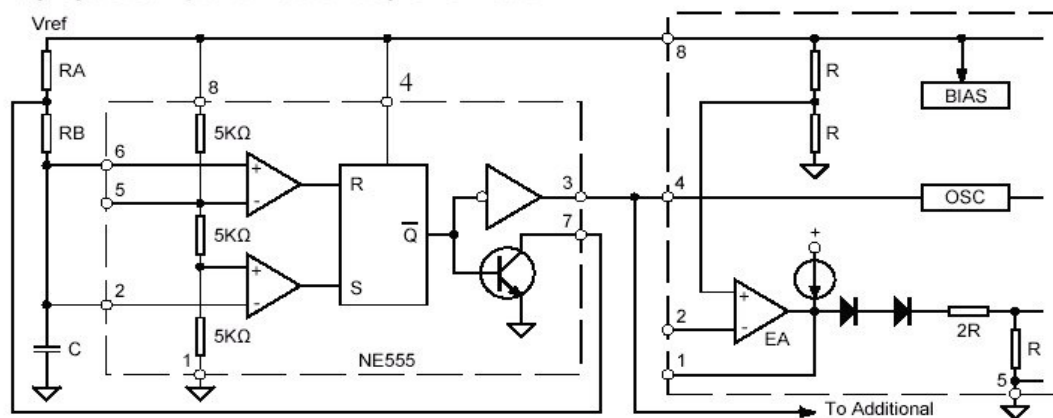

$$V_{\text{clamp}} = R_1 / (R_1 + R_2) \text{ where } 0 < V_{\text{clamp}} < 1V, I_{\text{pk}}(\text{max}) = V_{\text{clamp}} / R_S$$

Soft-Start Circuit

External Duty Cycle Clamp and Multi Unit Synchronization

$$f = 1.44 / ((R_A + 2R_B)C), D_{\max} = R_B / (R_A + 2R_B)$$
